FOREWORD

It is with pleasure that the South Carolina Crop and Livestock Reporting Service presents this 1984 edition of South Carolina Crop Statistics. The agricultural statistics in this publication include revised crop acres, yield, production and value statistics at the state and county level for 1982 and preliminary estimates for 1983. Also included are data on number of farms, land in farms, commercial fertilizer, fruit and vegetable statistics and quarterly on and off farm grain stocks estimates.

This bulletin, is a cooperative effort between the Statistical Reporting Service of the United States Department of Agriculture, and the Department of Agricultural Economics and Rural Sociology and South Carolina Agricultural Experiment Station of Clemson University. This cooperative relationship increases efficiency by avoiding duplication of effort and conflicting reports. The Federal program serves to provide comparable statistics for all states, which are released in national reports, while State funds make it possible to prepare and publish more detailed statistics for South Carolina such as those presented in this Bulletin.

We are indebted to thousands of South Carolina farmers who voluntarily give their time and effort to report various information relating to their farming operation. Without this voluntary cooperation, it would be impossible to make reliable estimates or compile this publication. Thanks to all of you who assist in this effort. In addition to the voluntary reporters, I want to publicly thank my staff for their dedication in preparing this bulletin.

Sincerely,

Roger M. Foster

Roger M. Foster
Agricultural Statistician
In Charge

The South Carolina Agricultural Experiment Station is a cooperative program financed from federal and state funds. It is the policy of the Experiment Station to comply with the regulations of Title VI, the Civil Rights Act of 1964. Complaints may be filed with the Director, S.C. Agricultural Experiment Station, Clemson University, Clemson, S.C. 29631.

1983 SOUTH CAROLINA CROP SUMMARY

JANUARY: Temperatures for January averaged below normal while precipitation fell in normal amounts. Snow and sleet fell on the northern part of the state on the 21st while freezing rain and sleet amounting to 1 to 3 inches of precipitation fell on the rest of the state.

The harvest of pecans and soybeans was completed the first part of the month, along with cotton scrapping. Tobacco bed seeding was finished, and other farm activities included pruning fruit trees, improving drainage, caring for livestock, and winter maintenance and repair on farm equipment.

FEBRUARY: February temperatures averaged normal and rainfall averaged greater than normal. The only precipitation fell in the form of snow and sleet during the first week of the month.

The Payment-in-Kind Program was introduced and farmers considered new opportunities and planting options.

Farmers tested soil, applied lime, pushed up old fruit trees and set new ones. Other chores were equipment maintenance and caring for livestock. Rain at the end of the month slowed preparation for spring planting and hindered fertilizer application to small grains.

MARCH: Temperatures for March generally stayed above normal with only a couple of exceptions. The last week of the month saw an intense snow storm dropping 6 to 10 inches over the northern part of the state, bringing freezing temperatures the last couple of days. Precipitation was well above normal and the worst flooding in 20 years occurred in northeastern South Carolina.

Rain further delayed preparation for spring planting and fertilizing small grain crops. Planting of corn and tobacco was considerably behind schedule. Heavy rains almost drowned tomato and other vegetable plants.

Warm weather caused peaches to bloom before the threat of a hard freeze was past. Peaches and apples still looked good after a light freeze.

APRIL: Rainfall during April averaged slightly above normal. Windstorms or tornadoes accompanied rain in the area of Aiken and Bamberg counties on the 16th. Temperatures averaged normal with the exception of an unseasonably hard freeze on the 18th and 19th, setting record low temperatures.

Most crops were making a small comeback after a wet March, but the freeze damaged all crops with peaches, apples, and tobacco being the hardest hit. Peaches were severely damaged with losses in the Ridge reaching 90 percent while the Piedmont was reporting a 50 to 75 percent loss. Apple damage was substantial but not nearly as severe as the previous year. Some orchards were completely stripped of fruit while others showed little loss. Overall, the crop was about half of normal. Blueberry and grape crops were also severely damaged.

Most tobacco producing counties replaced spots or as much as half of the crop. A transplant shortage induced purchasing from other states. Peanuts and cotton were behind schedule due to cold weather. Corn was growing out of the cold injury, but wheat in heading and blossoming stages was vulnerable to cold injury and damage was scattered statewide. Tomatoes faired okay, but other vegetables like watermelons, cucumbers, and cantaloupes had severe damage and had to be replanted.

MAY: May temperatures consistently stayed below normal, especially nights. Rainfall was below normal, but a storm with hail and high winds hit southern South Carolina on the 26th.

Most of the replanted or freeze-injured vegetables remained in fair condition in spite of cool temperatures and little rainfall, but the hail storm caused great damage to 1300 acres of vegetables. Peaches were rated poor to fair and had a larger drop than expected, so prospects declined. Peach and apple growers reported only a few disease and pest problems.

Tobacco and corn replanting proceeded rapidly after the April freeze. Cool weather increased pest problems for tobacco, corn, and cotton. Peanuts were planted in dry soil and remained in fair condition. Soybean seeding reached 33 percent and farmers worried about dry conditions for planting.

Small grains were hurt more by the freeze than previously suspected. Barley was worst hit, then rye, and wheat had 50 to 80 percent damage for early-headed varieties. Alfalfa was stunted by the cold as were pasture grasses for hay and grazing.

JUNE: Above average temperatures and low rainfall levels combined for near-drought conditions for June. Some localized thunderstorms weren't enough to generally provide crops with the moisture desired.

Corn showed a drought stress throughout most of the month with short periods of reprieve. Earworm infestations were reported statewide. The cotton crop showed improvement, but boll weevil and worm counts increased. Peanut condition improved to a fair to good rating over the month. Soybean planting progressed slowly during the dry weather, but neared completion with a few showers helping toward the end of the month. Tobacco declined to a fair rating over the month as potato virus Y (PVY) joined sucker control and Japanese beetles as major concerns.

Small grain harvest was about 95 percent complete by the end of the month. Pastures declined to a fair condition for lack of moisture.

Peach and vegetable harvests started towards the end of the month. All the vegetables were rated at good or fair to good condition. Peach production was far below normal. Apples remained in a fair to good condition.

JULY: Most areas got some rain early in July and a few places received downpours. Hot and humid weather changed to intense heat by mid-month. Soils were drying and workers avoided heat stress. Locally heavy rains in the northeast and south finally relieved some of the drought's effects.

Corn yields were hurt by the drought, especially during silking and maturing stages. Irrigation or local showers really made a difference as the crop was devastated where rains missed. Some of the cotton was not growing due to hot, dry conditions and bloomed at the top. The driest cotton shed squares. A few spots were sprayed for boll weevils reported by scouts. Peanut producers were anxious for rains to aid pegging and pod formation. Some of the late variety soybeans looked parched and were not growing as stresses limited development. Much of the soybeans began blooming and looked fairly good but the drought stunted some of the crop and lowered yield prospects. Tobacco was generally threatened by potato virus Y, so growers sprayed aphids to maintain control. Tobacco remained well behind the typical schedule. Only occasional flare-ups of insect infestations challenged growers as crops were generally pretty clean.

Peach shipments lagged last year due to earlier freezes that destroyed or damaged fruit in major producing regions. Many packers had to grade out a large percentage in order to ship sound fruit. Volume remained slack until major varieties ripened in the Piedmont, the latest maturing region.

Only 3 percent of watermelons were harvested before July 4. Growers produced some of the best quality tomatoes seen in years, but decreased prices sharply cut the profit margin. Watermelon value also fell. The hot sun scorched some vegetables. Pastures were browning in hot, dry weather. Summer hay crops were very short.

AUGUST: Some relief from heat came with early August statewide rains. Amounts were variable. Milder temperatures and spotty thunderstorms continued until mid-month when a record-breaking heat wave took over. Finally, most of the state obtained some relief due to light rains or scattered thunderstorms.

Dry stress was lowering most corn yields but some was helped by showers as harvesting began early in July. A few farmers salvaged distressed corn as silage. Cotton fruited well before stress stunted growth and caused shedding of squares and small bolls. Insect pressures were controlled nicely. Peanut stresses included earworm and fall armyworm pressures. Early planted soybeans fared better than late plantings during the heat wave. Some growers plowed up crops. Some reported blooms dropping due to drought conditions. Harvesting and curing tobacco was active, but later than usual. Diseases were kept under control.

Ridge peaches ripened with only a touch of fruit diseases. Piedmont harvesting got into full swing. A great percentage of field-run peaches were sold this season. Apples and grapes were harvested a bit ahead of last year. Heat and drought kept some apples from sizing properly. Pecans remained in poor to fair conditions due to earlier freezes and the general drought.

Hay cuttings this summer were about half of normal as pastures and hay crops were drought-stricken. Where rains helped, hay cuttings were near normal.

SEPTEMBER: Early September showers were general but some of the midlands received only slight amounts. Yield prospects generally lowered as hot, dry conditions persisted until mid-month. Corn conditions held at poor to fair. Nice yields were included among disappointing production and some corn was salvaged as silage. Cotton's poor condition continued all month as the crop cut out and harvesting began. Rains benefitted soybean yield prospects but some was being cut for hay where drought effects were severe. Insect pressure in some places required several sprayings. Half of acreages had weed and grass pressure.

Apple conditions improved with continuing showers helping sizes. Local apple quantities were sufficient to operate most packing sheds. Some fall vegetable seedling emergence was hurt by extreme heat, which also kept tomatoes from setting early fruit. Mid-September showers relieved weather stresses to vegetables.

Pastures' and fall hays' poor condition improved somewhat following rains. Some areas contended with fall armyworms.

OCTOBER: Normal temperatures prevailed until cooling mid-October rains arrived and became general. The month ended with nearly statewide soaking rains replenishing short soil moisture.

Corn was essentially harvested before mid-month with a wide range of yields in most counties. Cotton gins began operations with yields sometimes at a half-bale or less per acre due to the summer-long drought. Late-planted soybeans received above normal rainfall, extending the growing season. Most soybeans in the pods were much smaller than usual due to earlier drought stresses. Over half of acreages had at least moderate to heavy weed problems. There were a few scattered frosts at month's end, but green weeds prevailed and kept combines out of fields. Soybean conditions averaged poor to fair.

Statewide rains helped bring up seeded small grains and winter grazing. Their conditions were generally fair. Suffering pastures' condition improved with showers bringing a fair rating. Livestock condition improved to fair to good with producers supplying feedstuff where grazing was short.

NOVEMBER: Mild weather characterized November. Frosts were not general until after mid-month. Frontal movements brought showers each week.

Cotton harvesting and scrapping finished ahead of usual. Growers were disappointed with yields and quality. Soybean growers waited for a killing frost to burn back green weeds. Combines were interrupted by wet conditions. Yields include much that was only fair with a county ranging as wide as 5 to 40 bushels per acre. Crop conditions remained poor to fair. Grain sorghum was combined about on schedule. Tobacco producers began fumigating tobacco beds.

Pecan crop condition was poor to fair due to April freeze injury and drought stress. Truck crop producers wound up harvesting this month except for greens.

Winter grazing crops improved due to favoring weather to reach fair to good condition. Pasture conditions held to fair with interseeded clover benefitting from unseasonably mild weather. Rain was welcomed for new plantings of small grains. Wheat seeding was behind schedule. Overall condition of small grains was fair to good.

DECEMBER: Early December thunderstorms caused localized flooding and some wind damage. Persistent rains increased flooding. Temperatures varied about normal until severe cold on the 25th and 26th overspread the Palmetto State with many new low records. Sleet and freezing rain in the northwest was mere rain over the remaining areas.

Harvesting the soybean crop continued to lag normal schedules due to wet weather. Shorter than normal stalks and smaller beans led growers to carefully re-set combines to minimize losses.

Harvest of this season's short pecan crop got underway.

Pasture conditions reached fair to good in response to good growing conditions. Small grain's condition began to look good, although seeding following the soybean harvest will continue active through December. Livestock received needed care during threatening weather.

1983 SOUTH CAROLINA VEGETABLE SUMMARY

Based on a special survey funded by Clemson University, South Carolina's vegetable growers harvested a total of 40,065 acres of all vegetables, melons and berries in 1983. Commodities with the largest harvested acreage in decending order are: (1) watermelons, (2) cucumbers for pickles, (3) fresh market tomatoes, (4) sweetpotatoes, (5) fresh market cucumbers, and (6) fresh market snap beans.

Due to the severe weather conditions during 1983, vegetable production was reduced in all areas of the State. Despite the adverse weather, vegetable growers still managed to produce and sell a total combined vegetable crop valued at $46,779,000. Commodities whose value exceeded $1,000,000 during 1983 are: (1) tomatoes for fresh market, (2) sweetpotatoes, (3) cucumbers for pickles, (4) watermelons, (5) cucumbers for fresh market and (6) snap beans for fresh market.

More detailed information on the 1983 vegetable survey is published in the "South Carolina Vegetable Statisticis--AE429, April 1984."

1/Yield, production and average price in dozen bunches. 2/Yield, production and average price in dozen pints. 3/Includes: broccoli, cherry tomatoes, green onions, Irish potatoes, okra, bell peppers, turnips, miscellaneous vegetables, and snap beans and tomatoes for processing.

SOUTH CAROLINA FARM NUMBERS CONTINUE DOWNWARD

The number of farms in SOUTH CAROLINA in 1982 totaled 33,000 down 1,000 from 1981. For 1983, farm numbers dropped 2,000 to 31,000. Total land in farms was 6.1 million acres in 1982, down 3 percent from 1981. The preliminary estimate for 1983 land in farms is 5.9 million acres, down 3 percent. Average size of farm in 1983 is 190 acres - up 5 acres from 1982.

The number of farms in the UNITED STATES in 1983 is estimated at 2.37 million, down 1 percent from the 2.40 million in 1982. Total land in farms for 1983, is 1,035 million acres, down fractionally from a year earlier. In 1983, the average farm size is 437 acres compared with 433 in 1982. This slight increase occurred in the large farm category; the average size of all other farms declined.

A farm is defined as a place which has annual sales of agricultural products of $1,000 or more. The estimates based on this definition are available beginning with 1975.
